Taking Medication Safely

There is no medication to prevent or cure Alzheimer’s disease, but a number of drugs are used to treat Alzheimer symptoms. Physicians may also prescribe drugs to manage delusions and hallucinations, depression, agitation or sleepiness.

Although these medications can help manage symptoms, they can also produce side effects such as agitation, dry mouth, drowsiness, tremors, falling or constipation. Additionally, some medications taken for other medical conditions can actually increase Alzheimer’s disease symptoms. For example, a person who begins taking drugs for high blood pressure or a heart problem might appear to be more confused than before he or she began taking the drugs.

As a caregiver, you need to understand the use of medications, and be alert to possible overmedication and adverse reactions. To understand the effects of medications and how to manage their use, consider the following tips.

Get medical advice
Be cautious about giving any medication, whether it’s an over-the-counter or prescription drug.

• Begin by asking your physician to review all medications to check for possible drug interactions.
• Make sure that every physician involved with the person’s care knows about all prescribed medications.
• Find out as much as possible about every medication, including name, purpose, dosage, frequency and possible side effects. If serious side effects occur, report them to the physician.

Take medications only as directed
Use common sense when administering or obtaining medication.

• Under no circumstances should you change dosages without first consulting the physician.
• Avoid the temptation to over report symptoms in order to persuade your physician to prescribe a new drug or to increase the person’s dosage.
• Do not share medications with other caregivers or save the bottles of old prescriptions.

Rely on your pharmacist for information
Pharmacists can be another information source. Your local pharmacist can also check for interactions between drugs. However, keep in mind that pharmacists can neither prescribe drugs nor alter drug dosages.

Maintain accurate and ongoing records
Keep a written record of all current medications, including the name of the medication, dosage and starting date, and carry a copy of this list with you in your wallet or purse at all times. This record will be invaluable in the event of a serious drug interaction or overdose.
Be candid and direct
In clear, simple language help the individual understand the kinds of medications he or she is taking and why. In addition, you may want to offer clear instructions such as these: “Here’s the pill for your high blood pressure. Put it in your mouth and drink some water.”

Develop a routine for giving the medication
Giving medications in a specific way at specific times of the day or evening will help reduce resistance to taking it. If the person refuses to take the medication, stop and try again later.

- Never assume the individual will take medications on his or her own. It may be necessary to ask, or to check and see whether the medicine has been swallowed.
- At some point, you may need to assume responsibility for giving the person medications.

Stay organized
Separating pills into a plastic container with small compartments labeled “day” and “evening” or “Monday,” “Tuesday,” “Wednesday,” etc., will help track medications.

- Some caregivers find it useful to give medications in individual cups or envelopes, or to keep a calendar and check off each dose as it’s taken.

Adapt to the person
If the person has problems swallowing pills or spits out the pills, ask your physician if the medication is available in some other form, such as a liquid.

Some medications can be crushed and mixed with food. However, no pill, tablet or capsule should be crushed or opened without first consulting your physician or pharmacist. Crushing some medications may cause them to be ineffective or unsafe.

Take safety precautions
Put a lock on the medicine cabinet or place the medications in a locked drawer. If the person spits out pills, pick them up promptly to make sure these pills aren’t picked up and eaten by children or pets.

- Avoid leaving the person alone with medication bottles in the room.
- Be sure to dispose of all medications that have expired or are no longer used.
- Follow instructions provided or consult a pharmacist regarding safe disposal of each medication being discarded.

Be prepared for emergencies
Research the names and telephone numbers of pharmacies or other services that deliver medications. Also find out the names of pharmacies that are open on evenings and weekends.

- Keep the number of your local poison control center or emergency room handy.
- If you suspect a medication overdose, call poison control or 911 before taking any action.

The Alzheimer’s Association is the leading voluntary health organization in Alzheimer care, support and research.
