In a new study, researchers found that the incidence rate of type 2 diabetes among individuals of non-European ethnicity was even more pronounced compared to those with impaired glucose tolerance (IGT) who did not develop diabetes, according to a new study from New Zealand. The increased incidence rate underscores the importance of diabetes prevention efforts, especially among those at higher risk.

Individuals with impaired glucose tolerance (IGT) who develop type 2 diabetes face a higher incidence of dementia over 10 years compared with individuals with IGT who do not develop diabetes, according to a new study from New Zealand. The increased incidence rate underscores the importance of diabetes prevention efforts, especially among those at higher risk.

The Alzheimer's Association is the leading voluntary health organization in Alzheimer's care, support and research. Our mission is to lead the fight against Alzheimer's through the nation's leading volunteer service organization dedicated to Alzheimer's care, support and research. Our vision is a world without Alzheimer's and all other dementia.
