EFFECT OF COVID-19 ON PEOPLE WITH ALZHEIMER’S AND DEMENTIA

To date in 2020, there have been at least 34,851 more deaths than expected from ALZHEIMER’S DISEASE and DEMENTIA.

More than 662,000 COVID-19 CASES have been reported in long-term care settings.

37% of total COVID-19 DEATHS in the United States have been long-term care residents or workers.

12% of Medicare* beneficiaries have been diagnosed with dementia.

Yet, as of September 2020, 36% of Medicare* beneficiaries hospitalized for COVID-19 had a dementia diagnosis.

48% of nursing home residents HAVE DEMENTIA.

42% of all individuals in residential care communities, including assisted living facilities, HAVE DEMENTIA.

CAREGIVERS may receive less outside assistance, adding to already-high levels of caregiver strain.

INDIVIDUALS living with dementia may be especially isolated and may have trouble communicating virtually, potentially causing more rapid cognitive decline.
